

MB-60HI

Window system with a thermal break

In response to the ever-growing demand for building products with a high thermal insulation performance, the MB-60HI, MB-60US HI, MB-60E HI and MB-60EF HI window systems with a thermal barrier have been developed. Their construction is based on the proven and tested, expanded and valued base of MB-60, MB-60US, MB-60E and MB-60EF systems.

Similarly as for the base system, the MB-60HI system windows can also be individually installed as well as applied in aluminum façades. When they are used for filling in a mullion-transom wall, their use in combination with the MB-SR50 HI system with an improved thermal insulation is the most appropriate.
